Checklist for prescribing opioids for chronic pain

For primary care providers treating adults (18+) with chronic pain ≥3 months, excluding cancer, palliative, and end-of-life care

CHECKLIST

When CONSIDERING long-term opioid therapy

- □ Set realistic goals for pain and function based on diagnosis (eg, walk around the block).
- □ Check that non-opioid therapies tried and optimized.
- □ Discuss benefits and risks (eg, addiction, overdose) with patient.
- □ Evaluate risk of harm or misuse.
 - Discuss risk factors with patient.
 - Check prescription drug monitoring program (PDMP) data.
 - Check urine drug screen.
- $\hfill\square$ Set criteria for stopping or continuing opioids.
- □ Assess baseline pain and function (eg, PEG scale).
- \Box Schedule initial reassessment within 1–4 weeks.
- Prescribe short-acting opioids using lowest dosage on product labeling; match duration to scheduled reassessment.

If **RENEWING** without patient visit

 \Box Check that return visit is scheduled ≤ 3 months from last visit.

When REASSESSING at return visit

Continue opioids only after confirming clinically meaningful improvements in pain and function without significant risks or harm.

- □ Assess pain and function (eg, PEG); compare results to baseline.
- □ Evaluate risk of harm or misuse:
 - Observe patient for signs of over-sedation or overdose risk. - If yes: Taper dose.
 - Check PDMP.
 - Check for opioid use disorder if indicated (eg, difficulty controlling use). – If yes: Refer for treatment.
- $\hfill\square$ Check that non-opioid therapies optimized.
- □ Determine whether to continue, adjust, taper, or stop opioids.
- □ Calculate opioid dosage morphine milligram equivalent (MME).
 - If ≥ 50 MME/day total (≥ 50 mg hydrocodone; ≥ 33 mg oxycodone), increase frequency of follow-up; consider offering naloxone.
 - Avoid ≥90 MME/day total (≥90 mg hydrocodone; ≥60 mg oxycodone), or carefully justify; consider specialist referral.
- \Box Schedule reassessment at regular intervals (\leq 3 months).

REFERENCE

EVIDENCE ABOUT OPIOID THERAPY

- Benefits of long-term opioid therapy for chronic pain not well supported by evidence.
- Short-term benefits small to moderate for pain; inconsistent for function.
- Insufficient evidence for long-term benefits in low back pain, headache, and fibromyalgia.

NON-OPIOID THERAPIES

Use alone or combined with opioids, as indicated:

- Non-opioid medications (eg, NSAIDs, TCAs, SNRIs, anti-convulsants).
- Physical treatments (eg, exercise therapy, weight loss).
- Behavioral treatment (eg, CBT).
- Procedures (eg, intra-articular corticosteroids).

EVALUATING RISK OF HARM OR MISUSE

Known risk factors include:

- Illegal drug use; prescription drug use for nonmedical reasons.
- History of substance use disorder or overdose.
- Mental health conditions (eg, depression, anxiety).
- Sleep-disordered breathing.
- Concurrent benzodiazepine use.

Urine drug testing: Check to confirm presence of prescribed substances and for undisclosed prescription drug or illicit substance use.

Prescription drug monitoring program (PDMP): Check for opioids or benzodiazepines from other sources.

ASSESSING PAIN & FUNCTION USING PEG SCALE

PEG score = average 3 individual question scores (30% improvement from baseline is clinically meaningful)

- Q1: What number from 0-10 best describes your pain in the past week? 0="no pain", 10="worst you can imagine"
- **Q2:** What number from 0–10 describes how, during the past week, pain has interfered with your **enjoyment of life**?

0= "not at all", 10= "complete interference"

- **Q3:** What number from 0–10 describes how, during the past week, pain has interfered with your **general activity**?
 - 0="not at all", 10="complete interference"
